

Backlog — Type Cheat Sheet

Pick the right Type when adding an item to BACKLOG.xlsx

Type	What it means	Examples
Feature	New functionality that doesn't exist yet. You're adding a capability the user didn't have before.	"Add password reset flow" "Build a CSV export button"
Bug	Something already built that behaves wrong. The intended behavior exists but it's broken.	"Dropdown won't close" "Totals calculate incorrectly"
Refactor	Improving code that already works, without changing what it does for the user. Cleanup, restructuring, reducing duplication.	"Extract shared auth logic" "Split a giant component into smaller ones"
Chore	Necessary upkeep that isn't a feature, bug, or refactor. Dependencies, config, tooling, docs.	"Update packages" "Add an environment variable" "Set up linting"

Quick decision

Does it work right now, but you want it cleaner?	Refactor
Does it work wrong / not as intended?	Bug
Is it brand-new, user-facing functionality?	Feature
Is it behind-the-scenes maintenance?	Chore

Edge case: If you're improving code *and* changing behavior at the same time, call it a Feature (or Bug fix). Refactor specifically means the user-facing behavior stays identical — that distinction tells Claude Code how carefully to test the change.
